# **EXAM INSTRUCTIONS**

- Complete the **Student ID** and **Desk Number** details on the cover page
- Write all answers in the answer boxes
- Write your answers with a pen
- DO NOT use a red pen or marker
- Blank sheets are provided at the back of the exam for workings. These workings will not be marked.
- You may detach the blank sheets and formula sheets from the back of the exam paper (last 3 sheets of paper).

# PART A: ATTEMPT ALL QUESTIONS

# Question A1 (7 marks)

Consider the following matrices:

$$A = \begin{bmatrix} 96 & 96 & 14 \\ 16 & 47 & 42 \\ 97 & 80 & 92 \end{bmatrix} \qquad B = \begin{bmatrix} 39 & 96 & 5 \\ 66 & 3 & 10 \\ 17 & 28 & 82 \end{bmatrix} \qquad C = \begin{bmatrix} 68 & 76 & 74 \end{bmatrix}$$

Where A, B and C are double types.

| Note: If a MATLAB statement returns an error, write down "error".  |
|--|
| (a) Provide the syntax to create A, B and C.   |
|  |
|  |
| (b) Provide the output of <b>X</b> = <b>B-C</b>  |
|  |
| (c) Provide the output of [a,b] = size(C)  |
|  |
| (d) Provide a single-line syntax to create the following matrix by <b>only addressing entire rows</b> (not individual elements) of A, B and C. $S = \begin{bmatrix} 97 & 80 & 92 \\ 66 & 3 & 10 \\ 68 & 76 & 74 \end{bmatrix}$ |
|  |

| (e) Provide the output of <b>T = transpose(B)</b>  |
|--|
|  |
|  |
| (f) Provide the output of <b>U = sum(A)</b>  |
|  |
|  |
| (g) Provide the output of <b>V</b> = <b>find(A==B)</b>   |
|  |
|  |
| (h) Provide the syntax to add <b>a 4<sup>th</sup> column to B</b> which contains elements in the 1 <sup>st</sup> column of B raised to the power of 3. |
|  |
|  |
|  |

# Question A2 (6 marks)

Consider the following MATLAB function:

```
function [vr, reality] = helminth(sn,bt,dcp)
           pre = sum([sn,bt,dcp]);
           trans = sqrt(abs(bt - sn));
           post = sn.*bt;
           reality=0;
           vr=0;
           if pre < 5
              reality = floor(pre);
           elseif pre > 15
              reality = ceil(pre);
           else reality = pre.^2;
               vr = post.^3;
           end
Note: If a MATLAB statement returns an error, write down "error".
   (a) What are the input and output variables in the function declaration above?
   (b) Provide the name of the function and the extension format of the file?
   (c) What is the output of the following command?
              [vr, reality] = helminth(9,6,3)
```

| (d) Consider <b>x</b> = <b>[9, 9]</b> , <b>y</b> = <b>[6, 6]</b> , and <b>z</b> = <b>[3, 3]</b> . What is the result of: <b>[a, b]</b> = <b>helminth(x, y, z)</b> ?              |
|--|
|  |
|  |
|  |
| (e) Is it possible to convert the function provided at the start of this question to an anonymous<br>function? If yes, provide the syntax. If no, write "error" and explain why. |
|  |
|  |
| (f) MATLAB provides two warnings for the function provided at the start of this question.<br>Describe ONE of these warnings.   |
|  |
|  |
|  |

# Question A3 (6 marks)

Consider the following matrix defined by L = [-4:3:8; 4:-2:-4] and K = [1:5; 6:10], and logicals A = 0 (false) and B = 1 (true). Write the results of the MATLAB statement as specified in each question below.

| Note: If a MATLAB statement returns an error, write down "error".   |
|---|
| (a) Provide the output of <b>A   B</b>  |
|   |
|   |
| (b) Provide the output of A & B   |
|   |
|   |
| (c) Provide the output of $F = L > 0$   |
|   |
|   |
| (d) Provide the output of $G = (\sim(L > 0) \& (K < 4))$  |
|   |
|   |
| (e) Replace the □ <b>(square) symbol</b> in the following syntax <b>H</b> = <b>K</b> □ <b>L</b> so that it provides the logical result: |
| $H = \begin{bmatrix} 0 & 0 & 0 & 1 & 1 \\ 0 & 0 & 0 & 0 & 0 \end{bmatrix}$  |
| Provide the complete expression below.  |
|   |
|   |

|   | elements when the equivalent elements of L are odd.       |
|---|---|
|   |   |
|   |   |
|   |   |
| ( | (g) Describe why <b>short-circuit operators</b> are used. |
|   |   |
|   |   |
|   |   |
|   |   |

# Question A4 (8 marks)

Answer the following multiple-choice questions by writing the letter corresponding to the correct answer in the table provided below. Note: only one letter can be written in each box for each question. An example is provided below:

**EXAMPLE:** Which exam is this unit for?

- A. ENG1001
- B. ENG1002
- C. ENG1003
- D. ENG1005
- E. ENG1060

| QE: | E |

| Q6: |  |
| Q7: |  |
| Q8: |  |

- 1. Which one of the following is an invalid variable in MATLAB?
  - A. Witchwood = 5+6;
  - B. Hagatha witch =  $3^2$ ;
  - C. Phantom  $9 = pi + [1 \ 2 \ 3];$
  - D. R0tt3n = [3, 5]
  - E. Militia shaw = [35; 67]
- 2. What is the MATLAB function for finding the **natural logarithm of x**?
  - A. log10(x)
  - B. nlog(x)
  - C. 10log(x)
  - D. log(x)
  - E. None of the above
- 3. Which of the following statements creates a **logarithmically spaced vector from** 10° to 10° (inclusive) with 60 points?
  - A. logspace(10<sup>0</sup>, 10<sup>5</sup>,60)
  - B. logspace(10^0,60,10^5)
  - C. logspace(0,5,60)
  - D. logspace(0,60,5)
  - E. None of the above

- 4. What are the plot characteristics of the following command? plot(t, d, 'ro-')
  - A. Red circles, dashed line
  - B. Red circles, continuous line
  - C. Orange rectangles, dashed line
  - D. Red, dashed-dot line
  - E. Orange rectangles, continuous line
- 5. A .txt file which contains only numerical data is imported using **X=importdata()**. Which of the following is true?
  - A. X is a structure
  - B. X is a string
  - C. X is a double
  - D. X is empty
  - E. X is a character
- 6. Using **tline = fgetl** at the end of an open file in MATLAB results in tline equal to which of the following?
  - A. 0 (logical)
  - B. -1 (double)
  - C. 1 (double)
  - D. 1 (logical)
  - E. -1 (string)
- 7. Which of the following anonymous functions replicates the following function file? function R = revs(x,y,z)

$$R = x.^2 + y./z$$

end

- A.  $R = @(x) x.^2 + y./z$
- B. R @ $(x,y) = x.^2 + y./z$
- C.  $R = @(x,y,z) x.^2 + y./z$
- D.  $R = @(all) x.^2 + y./z$
- E. None of the above
- 8. Which of the following statements is true about the following code?

#### A=2; B = A + eps(A)/100

- A. A is equal to B
- B. A is less than B
- C. A is greater than B
- D. B is undefined
- E. Error

# Question A5 (6 marks)

Write MATLAB code for the following scenarios, ensuring that the commented instructions are followed.

| (a) Prompt the user for a value of $x$ , | and determine the value of | v based on the following cases. |
|--|----------------------------|---------------------------------|
| (5)                                      |                            | ,                               |

$$y(x) = \begin{cases} e^{x+1} & \text{for } x < -1\\ \cos(x) & \text{for } -1 \le x \le 5\\ 10(x-5) & \text{for } x > 5 \end{cases}$$

| % prompt the user for x   |
|---|
| % use if and elseif statements to determine y   |
|   |
|   |
|   |
|   |
|   |
| (b) The function primes(N) creates a vector containing prime numbers from 1 to N (inclusive)<br>Given z=primes(1000), determine how many values in z are less than 500. |
| z = primes(1000)  |
| counter = 0;  |
| % use a for loop to go through each value of z  |
| % use if statement to determine if counter should be incremented  |
|   |
|   |
|   |
|   |
|   |
|   |

| (c) Starting with $x=13.6$ , continue to double x until it is larger than 1337. |
|---|
| x=13.6;   |
| % use a while loop to check if x is larger than 1337                            |
|   |
|   |
|   |
|   |
|   |
|   |
|   |
|   |
|   |

# Question A6 (7 marks)

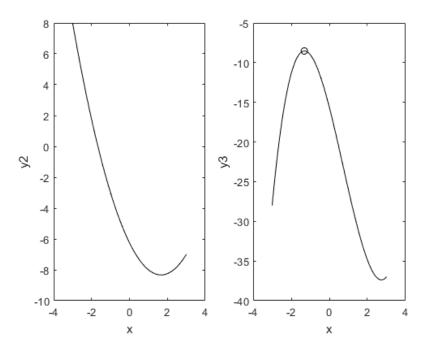

The figure below shows plots y2 against x and y3 against x. where:

$$y2 = x^2 - n^2$$

$$y3 = x^3 - n^3$$

Here, x is a vector of linearly spaced values from -3 to 3 (inclusive) with 300 points. The n variable is a vector of linearly spaced values from 1 to 4 (inclusive) with 300 points.

The line specifications for both plots are black continuous lines. The y3 plot has a maximum which is marked by a black circle.

Write MATLAB code in the following parts to reproduce the figure.

(a) This is the start of the m-file. Clear all variables, close all figure windows and clear the command window.

% start of m-file

(b) Create all relevant variables for plotting. Use element-by-element operators where appropriate.

% variable creation

| (c) Determ                    | ine the maximum y3 value and the corresponding x value.  |
|-------------------------------|--|
| % max y3 an                   | d corresponding x value  |
|                               |  |
|                               | <b>2 against <math>x</math></b> in the left panel of the subplot and label the plot accordingly. The line cation is a black continuous line.   |
| % plot y2 aga                 | ainst x  |
|                               |  |
|                               |  |
|                               |  |
| specific                      | <b>3 against</b> $x$ in the right panel of the subplot and label the plot accordingly. The line cation is a black continuous line. Also, <b>mark the maximum</b> $y$ 3 value with a black on the same plot. Refer to the figure at the start of this question. |
| % plot y3 aga<br>% mark the n | ninst x<br>naximum y3 value  |
|                               |  |
|                               |  |
|                               |  |
|                               |  |
|                               |  |

# PART B: ATTEMPT ALL QUESTIONS

# Question B1 (15 marks)

The average concentration of a substance  $\bar{c}$  (g/m³) in a lake can be computed by integration via:

$$\bar{c} = \frac{\int_0^D c(z)A(z) dz}{\int_0^D A(z) dz}$$

where z is the depth below the surface in metres, the area A and concentration c vary with depth, and D is the maximum depth in metres. Here, D=16. The average concentration can be calculated based on the following data:

| z (m)                  | 0   | 4     | 8     | 12   | 16  |
|------------------------|-----|-------|-------|------|-----|
| c(z) (g/m³)            | 10  | 8.5   | 7.4   | 5.2  | 4.1 |
| A(z) (m <sup>2</sup> ) | 9.8 | 5.1   | 1.9   | 0.4  | 0   |
| c(z)A(z) (g/m)         | 98  | 43.35 | 14.06 | 2.08 | 0   |

| (a) | Use the Composite Simpson's 1/3 rule with 4 segments to calculate the numerator integral                |
|-----|---|
|     | term $(\int_0^D c(z)A(z) dz)$ in the average concentration equation over the entire depth of the lake.  |
|     | Show ALL your working and provide answers to 4 decimal places.  |
|     |   |
|     |   |
|     |   |
|     |   |
|     |   |
|     |   |
|     |   |
|     |   |
|     | $\int_0^D c(z)A(z)\mathrm{d}z =$  |
|     | $J_0$   |
| (b) | Use the Composite Trapezoidal rule with 4 segments to calculate the denominator integral                |
| ( ) | term $(\int_0^D A(z) dz)$ in the average concentration equation over the entire depth of the lake. Show |
|     | ALL your working and provide answers to 4 decimal places.   |
|     |   |
|     |   |

$$\int_0^D A(z) \, \mathrm{d}z =$$

|     |  |                    |               |                    |              | $\bar{c} =$ |            |           |    |
|-----|--|--------------------|---------------|--------------------|--------------|-------------|------------|-----------|----|
| Со  | nsider now that the                                    | substance          | e will be tra | ansferred to       | o another lo | ocation via | a channel. | The avera | ge |

|    |                |
|    |                |

Place your results for y(x) from both methods into the following table:

| х   | y(x) Euler's method | y(x) Heun's method |
|-----|---------------------|--------------------|
| 0   | 1                   | 1                  |
| 0.5 |                     |                    |
| 1   |                     |                    |

c) The analytical solution to the ODE provided at the start of this question is given by:

$$y = \left(\frac{7x^2 + 2x}{2\sqrt{2}} + 1\right)^2$$

Calculate the percentage error in your predicted solutions **from parts (a) and (b) at** *x***=1** and write them in the box below (use 1 decimal point in the %). Is this the result you expect? Why or why not? Provide your explanation in the box below.

Note:  $Error = \left| \frac{predicted\ value-actual\ value}{actual\ value} \right| \times 100\%$ 

d) The function file for the midpoint method shown on the next page is incomplete as lines 29-31 are missing code. Complete the function file by writing the complete code in the box below.

| Line: 29 |  |
|----------|--|
| Line: 30 |  |
| Line: 31 |  |

```
1 function [t,y] = midpoint(dydt,tspan,y0,h)
2 % [t,y] = midpoint(dydt,tspan,y0,h):
3\, % uses midpoint method to solve an ODE
 4 % input:
   % dydt = function handle of the ODE, f(t,y)
 5
   % tspan = [<initial value>, <final value>] of independent variable
   % y0 = initial value of dependent variable
8 \% h = step size
9
   % output:
10 % t = vector of independent variable
  % y = vector of solution for dependent variable
11
12 % Input Validation: tspan
13
14 % Create all independant values, t
15 t = (tspan(1):h:tspan(2))';
16 n = length(t);
17
18 % if necessary, add an additional t so that range goes up to tspan(2)
19 if t(n) < tspan(2)
       t(n+1) = tspan(2);
20
       n = n+1;
21

# Question B3 (15 marks)

Consider the following equation:

$$f(x) = x^{10} - 1$$

(a) Perform 3 iterations of the bisection method to locate the root of f(x) using xl=0 (lower bound) and xu=1.3 (upper bound). Show your working for the **1**<sup>st</sup> **and 2**<sup>nd</sup> **iterations only** in the answer box **BELOW** the table. Then complete the following table using numbers to 4 decimal places.

| Iteration | xl | xu  | xr | f(xr) |
|-----------|----|-----|----|-------|
| 1         | 0  | 1.3 |    |       |
|           |    |     |    |       |
| 2         |    |     |    |       |
|           |    |     |    |       |
| 3         |    |     |    |       |
|           |    |     |    |       |

| Show working for the 1 <sup>st</sup> and 2 <sup>nd</sup> iterations here   |
|--|
| 1 <sup>st</sup> iteration  |
|  |
|  |
|  |
| 2 <sup>nd</sup> iteration  |
|  |
|  |
|  |
|  |
| (b) The bisection method appears to lose its convergence at the 3 <sup>rd</sup> iteration based on the<br>value of f(xr). Provide an explanation for this.                   |
|  |
|  |
|  |
| (c) Describe the difference between the bisection method and the false-position method in <b>how they estimate xr, using xl and xu</b> . Do not just refer to the equations. |

(d) Write an m-file that uses the **Newton-Raphson method to determine the value of** x **which satisfies**  $f(x) = x^{10} - 1 = 99$ . Use a precision of 10<sup>-5</sup> and an initial guess of x=0.5. Provide

# Question B4 (15 marks)

The rate of an enzyme-catalyzed reaction is represented by the Michaelis-Menten equation as follows:

$$v = \frac{v_m S}{K + S}$$

where v (dependent variable) is the rate of the enzyme catalyzed reaction and  $v_m$  is the maximum reaction rate. S (independent variable) represents the substrate concentration and K is a constant related to the substrate concentration. Below is a set of experimentally measured kinetic data for an enzyme catalyzed reaction.

| S | 1.3  | 1.8   | 3   | 6   | 9     |
|---|------|-------|-----|-----|-------|
| v | 0.08 | 0.125 | 0.2 | 0.3 | 0.333 |

(a) Linearise this non-linear model. Ensure you show ALL steps and working.

| (b) Relate the non-linear variables (S, $v$ , $v_m$ and $K$ ) to the linear variables ( $y$ , $a_0$ , $a_1$ and $x$ ) below. |
|--|

|                   | У | = | $\mathbf{a}_0$ | + | a <sub>1</sub> | Х |
|-------------------|---|---|----------------|---|----------------|---|
| Linearised model: |   | = |                | + |                |   |

(c) You will be required to fit a straight line to the linearized data using Least Squares Regression to obtain an equation of the form  $y = a_0 + a_1^*x$ . Show the values you need to first calculate by filling in the table below. (Do **NOT** show the arithmetic needed to calculate the sums/mean).

| i    | Xi | <b>y</b> i | X <sub>i</sub> Y <sub>i</sub> | Xi <sup>2</sup> |
|------|----|------------|-------------------------------|-----------------|
| 1    |    |            |                               |                 |
| 2    |    |            |                               |                 |
| 3    |    |            |                               |                 |
| 4    |    |            |                               |                 |
| 5    |    |            |                               |                 |
| SUM  |    |            |                               |                 |
| MEAN |    |            |                               |                 |

(d) ASSUME you obtained the values in the table below (instead of the values you calculated above in part (c)) and then calculate the linear coefficients a<sub>0</sub> and a<sub>1</sub>. Show your working.

| i    | Xi  | y <sub>i</sub> | $x_iy_i$ | X <sub>i</sub> <sup>2</sup> |
|------|-----|----------------|----------|-----------------------------|
| SUM  | 2   | 32             | 16       | 1                           |
| MEAN | 0.4 | 6.5            |          |                             |

| (e) From your results in part (d), calculate the new show the non-linear equation in the box as re |  |
|--|--|
|  |  |
|  |  |

(f) Write a function file which accepts vectors x and y and performs the least-squares linear regression on a set of linear data stored in x and y. Complete the following code:

| function [slope, intercept] = linreg(x,y)                      |
|--|
| % [slope, intercept] = linreg(x,y)                             |
| % inputs   |
| % x and y are vectors containing linearised data               |
| % outputs  |
| % slope is the gradient of the fitted line                     |
| % intercept is the value of the intercept on the vertical axis |
|  |
| n = length(x)  |
|  |
| SX =   |
|  |
| sy =   |
| sx2 =  |
|  |
| sxy =  |
|  |
| slope =  |
| lintana ant  |
| intercept =  |
|  |
|  |
|  |
|  |

## **Root Finding**

#### **Bisection Method**

$$x_r = \frac{x_l + x_u}{2}$$

#### **False Position Method**

$$x_r = x_u - \frac{f(x_u)(x_l - x_u)}{f(x_l) - f(x_u)}$$

### **Newton-Raphson** Method

$$x_{i+1} = x_i - \frac{f(x_i)}{f'(x_i)}$$

#### Secant Method

$$x_{i+1} = x_i - \frac{f(x_i)(x_{i-1} - x_i)}{f(x_{i-1}) - f(x_i)}$$

#### **Modified Secant Method**

$$x_{i+1} = x_i - \frac{f(x_i)(x_{i-1} - x_i)}{f(x_{i-1}) - f(x_i)} \qquad x_{i+1} = x_i - \frac{\delta x_i f(x_i)}{f(x_i + \delta x_i) - f(x_i)}$$

# **Curve Fitting**

### **Linear Regression:**

$$y = a_o + a_1 x$$

$$a_1 = \frac{n\sum x_i y_i - \sum x_i \sum y_i}{n\sum x_i^2 - \left(\sum x_i\right)^2}$$
$$a_0 = \overline{y} - a_1 \overline{x}$$

### Coefficient of **Determination**

$$r^2 = \frac{S_t - S_r}{S_t}$$

#### **Standard Deviation**

$$S_{t} = \sum_{i=1}^{n} (y_{i} - \overline{y})^{2}$$
$$S_{y} = \sqrt{\frac{S_{t}}{n-1}}$$

### Standard Error of the **Regression Estimate**

$$S_r = \sum_{i=1}^{n} (y_i - a_0 - a_1 x_i)^2$$
$$S_{y/x} = \sqrt{\frac{S_r}{n-2}}$$

### **Linearizing Nonlinear Models**

| Emedi Emg Hommed Prodes              |   |  |
|--------------------------------------|---|--|
| Nonlinear                            | Linearized  |  |
| $y = \alpha_1 e^{\beta_1 x}$         | $ \ln y = \ln \alpha_1 + \beta_1 x $                                      |  |
| $y = \alpha_2 x^{\beta_2}$           | $\log y = \log \alpha_2 + \beta_2 \log x$                                 |  |
| $y = \alpha_3 \frac{x}{\beta_3 + x}$ | $\frac{1}{y} = \frac{1}{\alpha_3} + \frac{\beta_3}{\alpha_3} \frac{1}{x}$ |  |

## Numerical Integration (*n* is the number of points)

### Trapezoidal Rule:

$$I = (b-a)\frac{f(b) + f(a)}{2}$$
$$E_t = -\frac{1}{12}f''(\xi)(b-a)^3$$

$$I = \frac{h}{2} \left[ f(x_1) + 2 \sum_{i=2}^{n-1} f(x_i) + f(x_n) \right]$$
where
$$h = \frac{(b-a)}{n-1}$$

### **Composite Trapezoidal Rule with Unequal Segments**

$$I = (x_2 - x_1) \frac{f(x_2) + f(x_1)}{2} + (x_3 - x_2) \frac{f(x_3) + f(x_2)}{2} + \dots + (x_n - x_{n-1}) \frac{f(x_{n-1}) + f(x_n)}{2}$$

### Simpson's 1/3 Rule

$$I = \frac{h}{3} [f(x_1) + 4f(x_2) + f(x_3)]$$

$$E_t = -\frac{1}{2880} f^{(4)}(\xi)(b - a)^5$$

### Simpson's 3/8 Rule

$$I = \frac{3h}{8} [f(x_1) + 3f(x_2) + 3f(x_3) + f(x_4)]$$

$$E_t = -\frac{1}{6480} f^{(4)}(\xi)(b-a)^5$$

Composite Simpson's 1/3 Rule: 
$$I = \frac{h}{3} \left[ f(x_1) + 4 \sum_{\substack{i=2,4,6,...\\i,\text{ even}}}^{n-1} f(x_i) + 2 \sum_{\substack{j=3,5,7,...\\j,\text{ odd}}}^{n-2} f(x_j) + f(x_n) \right]$$

Heun's Method

### **ODE: Initial Value Problems**

#### **Euler's Method**

$$y_{i+1} = y_i + f(t_i, y_i)h$$
  $y_{i+1}^0 = y_i + f(t_i, y_i)h$  
$$y_{i+1} = y_i + \frac{f(t_i, y_i) + f(t_i)}{2}$$

## **Midpoint Method**

$$y_{i+1}^{0} = y_{i} + f(t_{i}, y_{i})h$$

$$y_{i+1} = y_{i} + \frac{f(t_{i}, y_{i}) + f(t_{i+1}, y_{i+1}^{0})}{2}h$$

$$y_{i+1} = y_{i} + \frac{f(t_{i}, y_{i}) + f(t_{i+1}, y_{i+1}^{0})}{2}h$$

$$t_{i+1/2} = t_{i} + \frac{h}{2}$$

$$y_{i+1} = y_{i} + f(t_{i+1/2}, y_{i+1/2})h$$
